1. About the document

This document walks you through how to:

1. Install Eclipse
2. Create and run your first Java Application

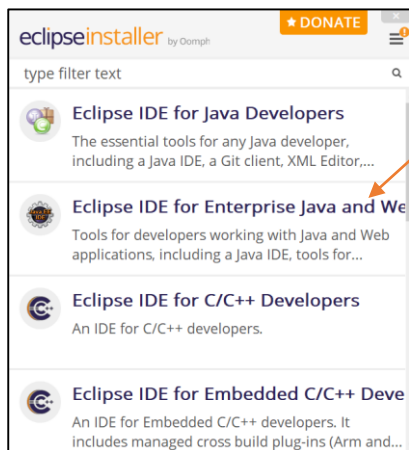

NOTE: The JDK and Eclipse installers for Windows are available on Moodle in the Tools topic.
For other operating systems, you can download from the Java and Eclipse websites.

2. Installation instructions

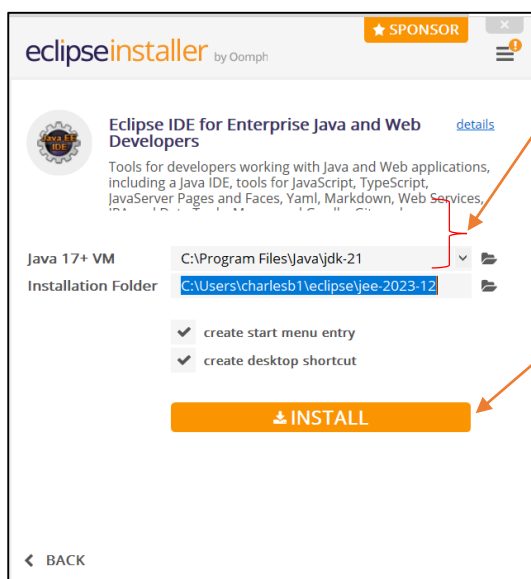

1. Install JDK
2. Install Eclipse

3. Installing Eclipse

1. Run the Eclipse installer
2. Select Eclipse IDE for Enterprise Java and Web Developers

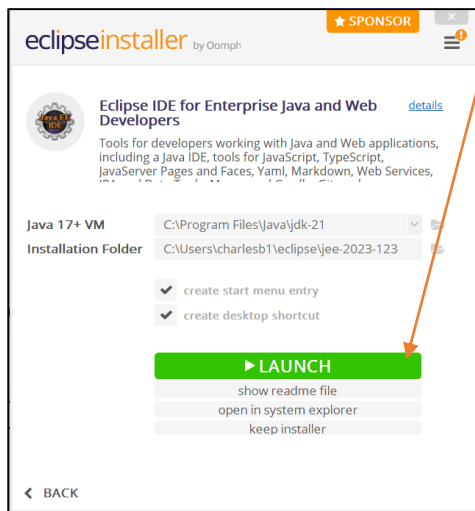

3. The installer selects the folder for jdk and Eclipse installation. Click **Install**

NOTE: Accept the “Warning” on unsigned (or [you can install previous versions of Eclipse](#))

4. Click on Launch to complete installation

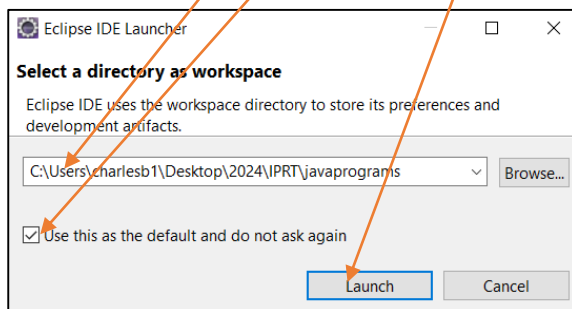

5. Click on the Eclipse icon in the Task bar to open

6. The Default folder is selected as workspace. NOTE (it is best if you create your own folder and select as workspace as shown below).

Click the box and Launch

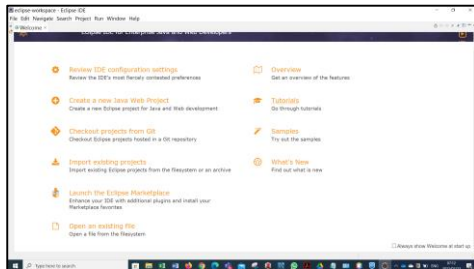

4. Creating your 1st Application in Eclipse

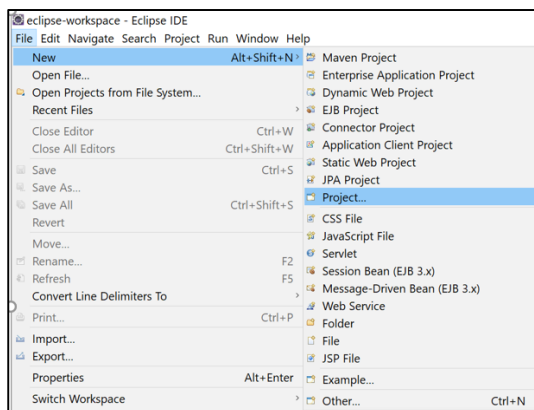

NOTE: In Java, you create programs in packages. However, Eclipse requires you to create packages in Projects.

1. Create a Project

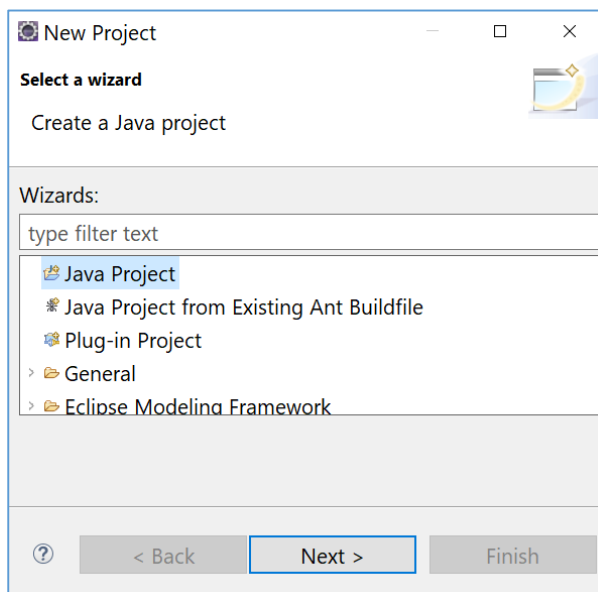

a. Close the Welcome window

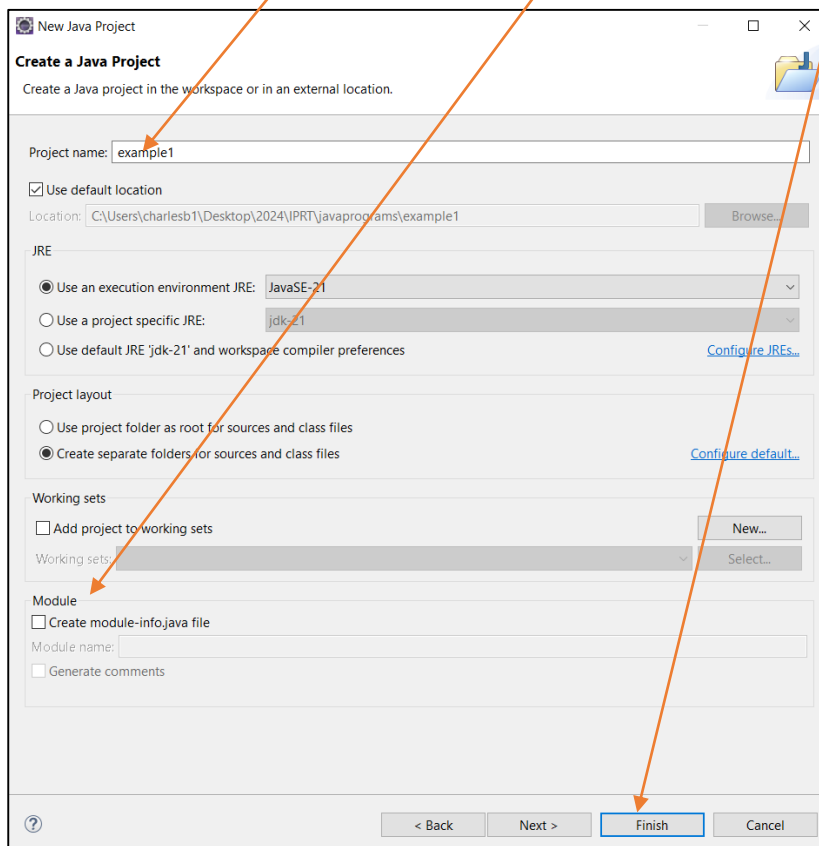

b. Go to File → New → Project

c. Select Java Project and click Next

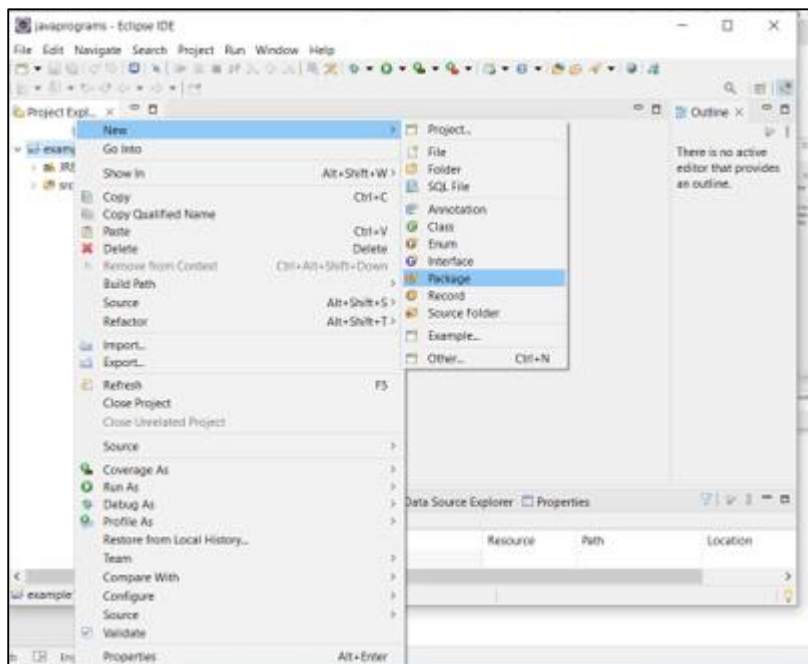

- d. **Enter the Project name** (note: Workspace is the default Location; you can change if you want to). Unselect the boxes under **Module**. Click **Finish**.

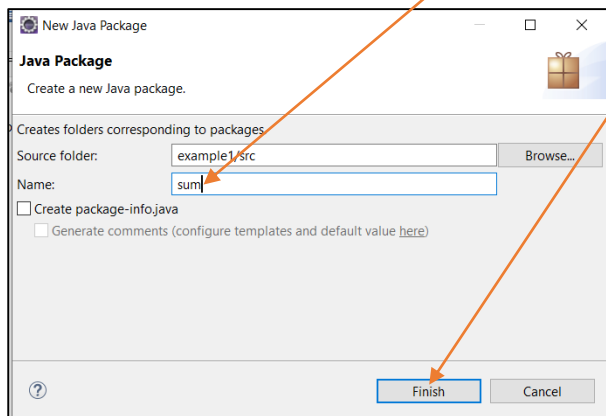

2. Create a package in the project

- a. Right-click the Project—> Select New—Select Package

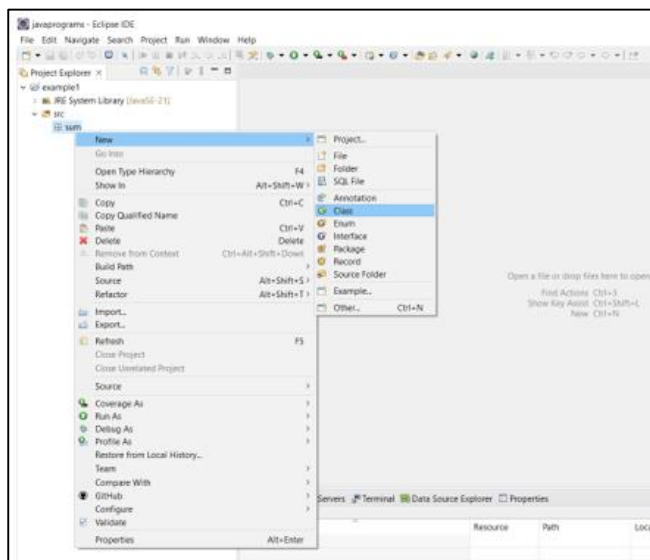

- b. Enter the package name(e.g., sum) and click Finish

3. Create the programs (e.g., class, interfaces, etc.) in the package

- a. Select the package to contain the program
b. Select New —>Class)

NOTE: we'll write many programs (e.g., classes, interfaces, etc.) in the same folder

- c. Enter the class name (e.g., Sum) and click Finish (we'll look at the other elements on this screen again)

New Java Class

Create a new Java class.

Source folder:

Package:

☐ Enclosing type:

Name:

Modifiers: ☒ public ☐ package ☐ private ☐ protected
☐ abstract ☐ final ☐ static
☒ none ☐ sealed ☐ non-sealed ☐ final

Superclass:

Interfaces:

Which method stubs would you like to create?

☐ public static void main(String[] args)
☐ Constructors from superclass
☒ Inherited abstract methods

Do you want to add comments? (Configure templates and default value [here](#))

☐ Generate comments

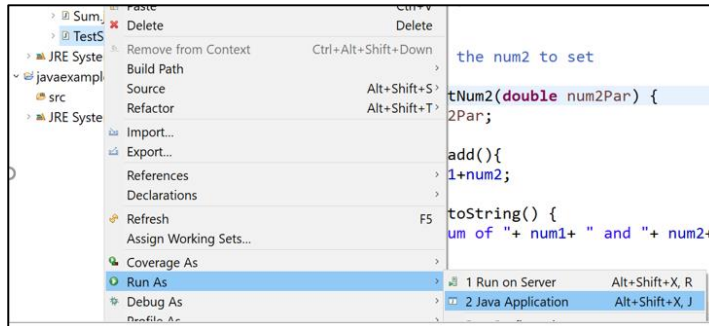

Note that Java is case sensitive (i.e., the package name (sum) and class name (Sum) are not the same)

5. Running Java application in Eclipse

Note: you run only classes which contains a **main** method in the Java application (in a package)

1st approach

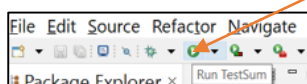

Right click the class which contains the main (or the package, project) and select Run As—>Java Application

OR

2nd Approach

Click the **Run** icon in the Menubar

6. Creating and running a simple Java program

1. Use the instructions above to create a project **example**, package **sum** and class **Sum**.
2. Delete the code in the class
3. Copy and paste the code for class **Sum.java** (on **Moodle**)
4. **In the same package**, create a class **TestSum.java**
5. Delete the code in the class
6. Copy and paste the code for class **TestSum.java** (on **Moodle**)
7. Save and run the class **TestSum.java**
