
Creating Java XML application in Eclipse

1. Create a new Java project called **xmlitems**
2. Create an XML file **items.xml** in the **project folder**
 - i. Right-click **xmlitems**, select New and Other
 - ii. In the wizard, type xml and select XML, XML file and click Next
In the new window, type the file name and extension (e.g.**items.xml**)

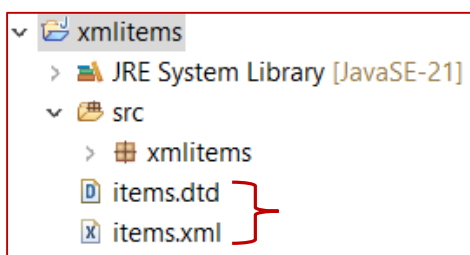

3. Write the XML code in **items.xml** and validate (right-click the file and select Validate)

```
<?xml version="1.0" encoding="UTF-8"?>
<!--A shop with many items; each item has code, name and price -->
<!DOCTYPE Shop SYSTEM "items.dtd">
<Shop>
  <Item>
    <code>00001</code>
    <name>Coke</name>
    <price>24.99</price>
  </Item>
  <Item>
    <code>00002</code>
    <name>Bread</name>
    <price>18.99</price>
  </Item>
  <Item>
    <code>00003</code>
    <name>Milk</name>
    <price>15.00</price>
  </Item>
</Shop>
```

4. Create a DTD file in the **xmlitems** project folder
 - i. In the wizard, select DTD file, type the file name and extension (e.g., **items.dtd**) and click Finish
 - ii. Write the DTD and save as **items.dtd**

```
<!-- Definition of items.xml document-->
<!ELEMENT Shop (Item)*>
<!ELEMENT Item (code, name, price)>
<!ELEMENT code (#PCDATA)>
<!ELEMENT name (#PCDATA)>
<!ELEMENT price (#PCDATA)>
```

The folder structure should look like this

5. Link the XML to the DTD file

This declares the root element(e.g., **Shop**) and the DTD file (e.g., **items.dtd**) in the [XML file](#) (in step 4)

```
<!DOCTYPE Shop SYSTEM "items.dtd">
```

6. Write the Java programs to read data from the XML file.
